Petroleum geochemistry has turned out to be more than another step in the direction to quantify geology and geosciences in general. Petroleum geochemistry as it is today may very well be the triggering event that brings the other branches of geosciences like sedimentology, stratigraphy, structural geology, geophysics and others to a fruitful synthesis as evidenced by integrated basin studies.

Petroleum geochemistry is a relatively young science, tracing its roots back to the 1934 discovery of chlorophyll-like structures in crude oil by Albert Treibs (1934). While many petroleum geologists as early as the late 19th century believed oil was derived from organic matter in sediments, Treibs ' findings were an undeniable proof of the organic origin of crude oil (Durand, 2003).

Petroleum geology is general geology applied to the search for and development of petroleum resources (petroleum is the collective noun for oil and gas). It centers around the stratigraphy and structure of sedimentary basins because virtually all the known petroleum reserves are in sedimentary basins. The methods of petroleum geology involve the more specialized topics of paleontology (q.v. in Vol. VII), sedimentology (q.v. Vol. VI) and geochemistry (see Exploration Geochemistry; Vol. XIII: ...
